

MedZ — MCQ Upload Format

Follow this format for every question in every PDF you upload to the Professor Dashboard. The AI extractor recognises this layout exactly; deviations are the reason a file returns "Could not detect any MCQs".

The 7 rules

1. One question per page.

Start each question on a new page. Do not put two questions on the same page.

2. Question header: "Q{N}. {stem}"

Begin with a capital Q, the question number, a period, a space, then the stem. End the stem with a colon or a question mark.

3. Four choices, lowercase letters: "a." "b." "c." "d."

Each choice on its own line. Lowercase letter, period, space, then the text. Up to five choices (a–e) allowed; four is standard.

4. Answer line: "Answer: {letter}. {full correct text}"

Exact word "Answer" (or "Answers"), colon, correct-choice letter, period, space, then the full text of the correct option.

5. Explanation line: "Explanation: {paragraph}"

Exact word "Explanation", colon, then one paragraph explaining the correct answer.

6. Per-choice rationales — one bulleted line per choice.

Use a hyphen "-" bullet, the choice letter with a period, then "WRONG" or "CORRECT" in all caps, an em dash "—" (or hyphen "-"), then the reason.

7. Reference line — the whole line must be inside square brackets.

[Reference: Dr. {Name}'s Notes, Page {N}, Section: {Section name}] — page number as a bare integer, section name as free text.

What to avoid

- Uppercase choice letters like "A." "B." — the parser expects lowercase.
- Roman numerals or bullets in place of "a.", "b.", "c." — use letters only.
- Multi-column layouts — write single-column, left-aligned.
- Scanned images of hand-written questions — printed or typed text only.
- Answer key on a separate page — the "Answer:" line must sit under the choices.
- Round brackets around the reference block — use square brackets [].

Example 1 — correct format (copy this shape)

Q1. Cowper's glands are characterized by:

- a. Provides 65% - 75% of seminal fluid
- b. Their duct joins the membranous part of the urethra
- c. They neutralize any traces of acidic urine
- d. Their secretion is rich in fibrinolysin

Answer: c. They neutralize any traces of acidic urine

Explanation: Cowper's (Bulbo-urethral) glands produce clear mucus secretion that lubricates the penile urethra and neutralizes any traces of acidic urine before the passage of semen.

- a. WRONG - It is the seminal vesicles that give 70-80% of seminal fluid, not Cowper's glands.
- b. WRONG - Their duct joins the initial portion of penile urethra, not the membranous part.
- c. CORRECT - Their function is to lubricate penile urethra and neutralize acidic urine traces.
- d. WRONG - It is the prostate whose secretion is rich in fibrinolysin, not Cowper's glands.

[Reference: Dr. Ahmed Zahra's Notes, Page 37, Section: The Bulbo-Urethral (Cowper's) Glands]

Example 2 — correct format

Q2. Which of the following characterizes the mature Graafian follicle?

- a. Theca interna cells can differentiate into smooth muscle cells
- b. Gap junctions are present in the perivitelline space
- c. Corona radiata is a single layer of flat cells
- d. Theca externa secrete androgen

Answer: b. Gap junctions are present in the perivitelline space

Explanation: In the mature Graafian follicle, corona radiata cells send cytoplasmic processes that penetrate zona pellucida and contact oocyte microvilli via gap junctions in the perivitelline space.

- a. **WRONG** - Theca interna cells secrete androgen and do not differentiate into smooth muscle.
- b. **CORRECT** - Gap junctions sit in the perivitelline space between corona radiata and oocyte.
- c. **WRONG** - Corona radiata is a single layer of columnar granulosa cells, not flat cells.
- d. **WRONG** - It is theca interna that secretes androgen; theca externa has no secretory role.

[Reference: Dr. Ahmed Zahra's Notes, Page 47, Section: Mature Graafian (Tertiary) Follicles]

Example 3 — every field filled the same way

Q3. The blood-testis barrier is formed by:

- a. Tight junctions between Leydig cells
- b. Tight junctions between adjacent Sertoli cells
- c. The basement membrane of seminiferous tubules alone
- d. Peritubular myoid cells

Answer: b. Tight junctions between adjacent Sertoli cells

Explanation: Sertoli cells are linked by occluding tight junctions that split the seminiferous epithelium into basal and adluminal compartments – the blood-testis barrier.

- a. WRONG - Leydig cells lie in the interstitium and do not form the barrier.
- b. CORRECT - Sertoli-Sertoli tight junctions form the barrier.
- c. WRONG - The basement membrane alone is not sufficient to isolate germ cells.
- d. WRONG - Myoid cells assist tubule contraction but do not form the barrier.

[Reference: Dr. Ahmed Zahra's Notes, Page 21, Section: Seminiferous Tubules & Blood-Testis Barrier]

Wrong: this is what NOT to do

The following block will FAIL extraction — no "Q" prefix, uppercase choice letters, "Correct answer" instead of "Answer:", and round brackets around the reference. Do not use it.

- 1) What is the functional unit of the kidney
- A) The renal lobule
 - B) The nephron
 - C) The medullary pyramid
 - D) The collecting duct
- Correct answer is B
